Drone Service Management System Using Zoho Creator

Problem Statement

A drone service company provides services such as aerial photography, agricultural spraying, land surveying, package delivery, and infrastructure inspection. Currently, all customer requests, drone inspections, and maintenance records are managed manually, leading to delays, duplicate entries, and inefficient tracking. To improve productivity and automate the service process, the company plans to develop a Drone Service Management System using Zoho Creator.

Design and develop a Drone Service Management System that automates the complete workflow from customer service requests to drone inspection and maintenance. The application should make use of Zoho Creator Forms, Reports, Pages, Deluge Scripts, Workflow Automation, Dataset Import, and AI Features.

Project Requirements

1. Create Two Forms
    - Service Request Form to capture customer service requests.
    - Drone Inspection Form to record drone inspection and maintenance details after service completion.
2. Use Basic, Advanced, and AI Fields
    - Basic Fields: Auto Number, Single Line, Number, Email, Phone, Date, Dropdown, Multi-line.
    - Advanced Fields: Lookup, File Upload, Image Upload, GPS/Location, Formula, Decision Box.
    - AI Fields: Keyword Extraction, Category Prediction, Sentiment Analysis, Image Recognition, or Object Detection.
3. Develop 2–3 Deluge Scripts

- Automatically set Service Status to *Pending* after submission.
- Calculate the Estimated Completion Date based on the Service Date and Estimated Duration.
- If Damage Severity is *Major*, automatically set Maintenance Required to *Yes* and notify the administrator.

4. Create One Workflow (On Success)
    - Configure an On Success Workflow for the Service Request Form. After successful submission, the workflow should automatically update the service status, generate a service reference number, calculate the estimated completion date, assign the appropriate drone category, notify the manager for high-priority requests, create an inspection record, and display a confirmation message.
5. Dataset Import
    - Import a dataset containing 20–30 sample service request records into the Service Request Form for testing and report generation.
6. Reports and Dashboard
    - Create reports for Service Requests and Drone Inspections.
    - Design a dashboard/page to display charts such as Total Requests, Pending Services, Completed Services, High-Priority Requests, and Drones Under Maintenance.
